WhatsApp CRM - SaaS Launch & Feature Development

Developer task board | Version 1.2 | 25 October 2026 | Supersedes version 1.1 of the same day

What changed in 1.2

- **All seventeen tasks are built.** Thirteen are **Done**: built, tested and live. Four are **Ready to verify** (CRM-002, 010, 016, 017): the code is finished and tested against a simulated Razorpay, but only the owner can supply the last step: Razorpay test keys and a webhook secret, a test-mode run, and the accountant's sign-off on the invoice fields.
- **The owner's decisions are recorded** on the next page and built as given.
- **Effort estimates are gone**, as asked. Each task now says what was built and what is left.
- **Verification:** 443 automated tests on the server and 406 on the screens pass. Safeguards that matter (signatures, amounts, limits, access, alerts) were deliberately broken to confirm a test fails when it should.

Status key: **Done** built, tested and live **Ready to verify** built and tested, waiting for something only the owner can supply **Partly** some of the scope is built **Not started** **Not required** left out by an owner decision.

Owner decisions (answered 25 October 2026) and what was built

#	Question	Answer	Built
1	Yearly price	As per market rate, with a bit of discount.	A year costs ten months (two months free) on every paid plan; the prices are in CRM-001 and can be edited by the platform admin.
2	UAE customers and AED	Say "coming soon" for the international gateway; integrate only the Indian gateway now.	Online payment is in rupees. AED companies see "Online payment for the UAE is coming soon" in the plan comparison and on the website's pricing page; the team invoices and records AED payments by hand.
3	GST invoicing	Use the GST details from the PDF (registration certificate).	CRM-017: seller details as on the certificate; 18% GST, CGST + SGST for Uttar Pradesh buyers, IGST elsewhere; invoice PDF; gapless series.
4	Autopay now or later	Autopay only for users who are willing.	CRM-016: opt-in per company, monthly plans only; "pay for the next period" stays the default.
5	Trial and late payment	Seven days of overdue is accepted.	Seven days of grace after the renewal date; then paid features switch off and the company has Free's limits; nothing is deleted and paying restores everything at once. The Free plan is the trial.
6	Who may pay and see invoices	Both (owner and administrator); then the answer about where people go after paying was cut off.	Owners and administrators can pay and see invoices; no Finance role. After paying, the person stays on Plans & Billing with a confirmation and the invoice. **Please confirm or name another page.**

#	Question	Answer	Built
7	Razorpay account	Not yet answered.	Test keys and a webhook secret are still needed (see the open items).

Product today

- **Inbox and numbers:** shared live inbox over several linked WhatsApp numbers; waiting and overdue chats flagged against the reply target; filters by person, team, label and activity; pinned chats; New chat for any number; contact names that keep WhatsApp's name apart; coloured labels; a health card for every number; automatic assignment of new chats; "is writing a reply" warning.
- **Plans and money:** Free, Starter, Growth, Business, Enterprise with prices read from the database, yearly prices, 18% GST, invoices, contact and broadcast limits a plan can set, seven-day grace then Free's limits, online payment and autopay built and waiting for Razorpay keys.
- **Team performance:** reply-time reports, leaderboard, targets per team, a daily summary for owners, follow-ups with escalation.
- **Sales pipeline, broadcasts, automations, Riwo (AI):** as before; summaries now include the customer's mood.
- **Platform admin:** company directory and subscriptions, plans and prices, online payments, an overview of the whole platform, every company's number health, a billing audit, and logged support access.

Implementation order / delivery gates

Gate	Must ship	Exit condition	Status 25 Oct
G1 / P0	Plans + paid checkout + subscriptions + usage enforcement	Real test payment correctly creates/renews one tenant subscription; no cross-tenant access.	**Ready to verify** Everything is built; the real test payment is the open step.
G2 / P0	Contact names + direct chat + labels and filters	Agent can create/edit/contact, initiate allowed outbound messaging and find contacts by label.	**Done**
G3 / P1	Response-time reporting + inbox productivity	Owner sees accurate agent stats including unanswered chats and SLA performance.	**Done** Pending the owner's check of five replies by hand (QA list).
G4 / P1-P2	Renewal UX + reports + automation + optional AI	Production readiness sign-off and pilot customer acceptance.	**Done** Built; sign-off and a pilot customer are the owner's.

Master task register

Task ID	Priority	Scope	Status	What is built, and what is left
CRM-001	P0	Plan catalog & pricing	**Done**	Plans, limits and monthly and yearly prices in the database; the platform admin edits them without a release; the website, the app and checkout read the same catalogue.

Task ID	Priority	Scope	Status	What is built, and what is left
CRM-002	P0	Checkout, gateway & verified webhook (Razorpay)	**Ready to verify**	Built and tested against a simulated Razorpay. Needs the owner's Razorpay test keys and webhook secret, then the test-mode run, before it is switched on.
CRM-003	P0	Subscription lifecycle & access limits	**Done**	States from dates, 7-day grace then paid features off, pending payment, contact and monthly broadcast limits with warnings, live usage.
CRM-004	P0	Contact name save/edit	**Done**	Edit from Inbox and Contacts; WhatsApp name kept apart; numbers normalised; duplicates handled; each rename on the audit log.
CRM-005	P0	Direct message / start chat	**Done**	New chat for a typed number, number checked on WhatsApp, sending number chosen, consent warning.
CRM-006	P0	Labels, contact & inbox filters	**Done**	Coloured company labels, bulk labelling, any/all label filters in Contacts and Inbox; old tags moved over.
CRM-007	P1	Reply-time metrics and leaderboard	**Done**	Median and 90th percentile, share inside the target, leaderboard, waiting chats, CSV.
CRM-008	P1	Inbox filters + quick actions	**Done**	Waiting, overdue, mine, unassigned, team, label, activity; pinned chats; "is writing a reply" warning.
CRM-009	P1	Follow-up and escalation	**Done**	Follow-ups on a chat with no lead, escalation of overdue ones, reassignment on the record.
CRM-010	P1	Billing self-service + invoices	**Ready to verify**	Pay, renew, upgrade with credit, smaller plan or cancel at period end, retry, invoices and history, for owners and administrators. Shares CRM-002's open step.
CRM-011	P1	Owner daily reporting	**Done**	Morning summary in the app and by email; by number, team and person; drill into the chats; CSV.
CRM-012	P1	Number health	**Done**	Heartbeat every minute, since-when connected or down, reconnect tries, failed and waiting sends per number, alerts.
CRM-013	P2	Lead assignment rules	**Done**	In turn or least busy, chosen people, numbers, team, limit, working hours, returning customers, away switch.
CRM-014	P2	AI chat summaries and mood	**Done**	Summaries as before, now with how the customer sounds (positive, neutral, frustrated, urgent).
CRM-015	P2	SaaS super-admin console	**Done**	Platform totals, every company's number health, billing audit, support access that is logged and visible to the company.

Task ID	Priority	Scope	Status	What is built, and what is left
CRM-016	P1	Razorpay autopay	**Ready to verify**	Opt-in, monthly plans only; tested against a simulated Razorpay. Same open step as CRM-002, plus the recurring-debit limit check with Razorpay.
CRM-017	P1	GST invoices and receipts	**Ready to verify**	Gapless numbered invoices with CGST + SGST or IGST and a PDF; the accountant confirms the fields and the service code before the first live invoice.

Task detail

CRM-001 | Plan catalog & pricing (P0) Done

Built. Five plans (Free, Starter, Growth, Business, Enterprise) in the `plans` and `plan_prices` tables (migration 018); the server reads them, so no price comes from the browser. The platform admin changes name, numbers, people, features, prices, whether a plan is for sale, and the two limits from CRM-003, from *Plans & prices*; every change is recorded with what it was before. Owners and administrators see *Team → Plans & Billing* with a comparison of plans.

Yearly price (decision 1). A year costs ten months: two months free. Monthly stays as published.

Plan	Monthly INR	Yearly INR	Monthly AED	Yearly AED
Starter	2,499	24,990	299	2,990
Growth	6,999	69,990	799	7,990
Business	14,999	1,49,990	1,699	16,990

Indian prices exclude 18% GST; AED prices exclude 5% VAT. Free and Enterprise have no list price. The platform admin can change any of this at any time.

Trial (decision 5). The Free plan is the trial; no timed trial is offered. The catalogue keeps a trial-days field that nothing uses.

Verified by the plan catalogue and plan admin tests (backend) and the plan comparison and plans editor tests (screen).

CRM-002 | Checkout, gateway & verified webhook, Razorpay (P0)

Ready to verify

Built to the specification in 1.1. `POST /api/billing/checkout` prices the order on the server (plan, yearly or monthly, credit for unused days on an upgrade, GST) and creates a Razorpay order; Standard Checkout opens in the browser; the checkout signature is checked against the order id stored on the server; `/api/billing/razorpay/webhook` takes the raw body, checks the webhook signature with its own secret, and stores each event id once. One function, `settleOrder()`, activates the plan; it locks the order, checks status, amount, currency and company, and a mismatch activates nothing and shows to the platform admin. The browser's verify call asks Razorpay's servers about the payment (and captures an authorised one); a job every few minutes recovers lost webhooks; unpaid orders expire after 24 hours; the webhook returns quickly and an unprocessed event is retried. Secrets are only in the server's environment file.

Verified so far: automated tests against a simulated Razorpay: a good payment, a failed payment, a tampered signature, a wrong amount, a wrong company, a duplicate webhook, webhook before verify, verify before webhook, a lost webhook recovered, paying a period already paid. Safeguards were broken on purpose to confirm each test fails when it should. **Not yet done:** a single call to the real Razorpay. `/health` reports `payments.configured: false` until the three settings below exist.

> **To go live (owner):** create Razorpay test keys and a webhook secret and put `RAZORPAY_KEY_ID`, `RAZORPAY_KEY_SECRET` and `RAZORPAY_WEBHOOK_SECRET` in the server's environment file, never in chat or in the repository; add the webhook address in the Razorpay dashboard; run the test-mode checklist at the end of this document; confirm in the dashboard's delivery log that the event-id header arrives; only then use live keys.

CRM-003 | Subscription lifecycle + limits (P0) Done

Built. A company's state is worked out from its dates every time: free, original workspace plan, no payment recorded, active, due soon, overdue, expired, changing, cancelling. **Late payment (decision 5):** seven days of grace after the renewal date, then the company has what Free has (paid features off); nothing is deleted and paying brings everything back at once. While a payment is in progress the order shows as created or attempted and Plans & Billing says it is activating. A smaller plan removes nothing the company already has.

Limits. Numbers, people and features were already enforced on the server. Added now: *contacts* and *broadcasts started per calendar month* are limits a plan can carry (blank means no limit; none is set on any plan today, and the pricing page advertises none). When a plan sets one: a person adding contacts by hand, a file import (a batch that would go over is not saved), New chat to a new number, and copying contacts from the phone all stop at the limit with the reason; starting a broadcast beyond the month's count is refused. A customer's message is never refused, and nothing is deleted. A broadcast counts when first started, so a pause and restart is not counted twice.

Usage and warnings. Counted live from the data (no separate counter table, so it cannot drift). Plans & Billing and Contacts show a bar that turns amber at 80% and red at the limit.

Verified by subscription, billing and plan-limit tests, including that each enforcement point fails its test when removed.

CRM-004 | Save/edit contact name (P0) Done

Built. Edit the name from the Inbox panel or Contacts. WhatsApp's profile name is kept in its own field and never overwrites a name a person typed; a typed name can be handed back to WhatsApp's. Numbers are normalised to the international form; saving a number twice returns a clear message pointing at the existing contact (HTTP 409); every rename is written to the audit log.

CRM-005 | Direct WhatsApp message (P0) Done

Built. *New chat* in the Inbox: type a number, see whether it is already a contact, choose which connected number to send from (only ones the person may use), and get a plain message if the number is not on WhatsApp. A warning shows when the person has not agreed to messages. Sending uses the normal path with delivery states.

CRM-006 | Labels & filtering (P0) Done

Built. Company-owned coloured labels (`labels`, `contact_labels`, migration 019), many per contact, bulk add and remove, label filters in Contacts and Inbox with *any* or *all*, and a *No label* filter. Old free-text tags were moved into labels; broadcast audiences still work from them. Labels never cross companies.

CRM-007 | Employee reply analytics (P1) Done

Built. Waits are computed from the customer's first unanswered message to the next human reply; automatic replies, broadcasts, team notes and groups are left out. Median and 90th percentile with a minimum sample of five, the share answered inside the target (a company target and a different target per team), leaderboard, chats still waiting, per-day trend, drill-down to the chats behind a number, and CSV export (formula-safe).

CRM-008 | Inbox quick actions (P1) Done

Built. Filters for waiting and overdue (past the reply target), assigned to me, unassigned, team, label and recent activity; a chat shows how long the customer has waited, red once past the target; pinned chats sit at the top; and a warning appears when a teammate is writing a reply in the chat you have open. Filtering is on the server with paging.

CRM-009 | Follow-up reminders and escalation (P1) Done

Built. A follow-up can be set from a chat that has no lead; assignment to another person (managers) is on the record and tells that person; one that stays overdue past the company's chosen number of hours (default 24, 0 turns it off) tells the owner and administrators once and shows as Escalated in the Today list.

CRM-010 | Customer billing self-service (P1) Ready to verify

Built. *Team → Plans & Billing*: the current plan with usage; pay now, renew early (the period is never shortened), upgrade (unused days are credited), schedule a smaller plan or cancellation for the end of the period, retry a failed payment; invoices and payment history with PDF download; billing details form. **Who may pay and see invoices (decision 6): both owners and administrators.** A separate Finance role is therefore not built and not needed.

After payment: the person stays on Plans & Billing, sees "Payment received" with the new end date, and the invoice appears in the list. The second half of the owner's answer to decision 6 (where to send people after paying) arrived incomplete; if a different page is wanted, say which.

Status follows CRM-002: the payment path has only run against a simulated gateway.

CRM-011 | Owner daily reporting (P1) Done

Built. A morning summary of yesterday for owners and administrators in the app (and by email to the owner if switched on): new chats, replies, median wait, share inside the target, chats still waiting, top person, by number, by team and by person, each with the list of chats behind it. Report settings are in Reports.

CRM-012 | Number health (P1) Done

Built. The server asks every number it runs whether it is still connected once a minute and remembers the answer (`last_heartbeat_at`, misses in a row), since when it has been connected or down, how many times the server brought it back by itself, failed and uncertain sends in the last 24 hours and the last hour, and messages still waiting to leave. The *Numbers* screen shows this on each card in plain words; owners and administrators see every number, staff their own. **Alerts** go once per six hours to the number's owner and the managers when a number does not answer three checks in a row, has been down 30 minutes, fails most of its sends (at least five in an hour), or has a message waiting more than ten minutes.

Verified by tests with simulated numbers (answering, refusing, throwing, hanging) and by breaking each rule on purpose. **Still to see:** on the live server, that the "Last check" on a connected number moves every minute (it asks WhatsApp Web's own `isConnected()`).

CRM-013 | Automatic lead assignment (P2) Done

Built. *Automations → Automatic assignment*. When a customer writes to a new chat on a number the company chose, it goes to a teammate: *in turn* (continuing after whoever got the last one) or *least busy*. Only people the company put in the rotation, who have not switched themselves *Away* in the Inbox, and (optionally) only one team, take chats; an optional limit on open chats per person; optional working days and hours in the company's time zone; a returning customer goes back to the owner of their open lead. With nobody available the chat stays unassigned like today. Only the first message of a chat triggers it, so a chat a manager unassigned on purpose is not taken back. Each assignment is on the audit log and tells the person. The existing rule "assign to a teammate" now also gives that person access to the chat.

CRM-014 | AI conversation summaries (P2) Done

Built. Summaries as before (a person always reads and sends; phone numbers and media are not sent; customer messages are data, not instructions). New: a *Mood* beside the summary, one of positive, neutral, frustrated or urgent with a few words why. It describes the chat, not the person, is shown only with a summary someone asked for, and is dropped if Riwo answers with any other word.

CRM-015 | SaaS super-admin console (P2) Done

Built. On the platform screen: *Overview* (companies, people, numbers connected, messages sent and received, Riwo use, payments recorded; counts only), *Number health* (every company's numbers with the ones needing attention first, phone numbers shortened to four digits), *Billing audit* (money against invoices and a list of what does not add up: payments that did not match, paid at the gateway but not settled here, no subscription record, no invoice, gateway messages not processed, gaps in invoice numbers, bad signatures), and *Support access* per company. The platform admin still cannot read a company's chats.

Support access that is logged. Looking at a company's team, numbers or account activity needs a stated reason (at least 10 characters) and opens a session of 5 to 240 minutes. The company's owner and administrators are told when it opens, and *Team → People* lists every session with who, why and what was looked at. Chats, contacts and files are not part of it.

CRM-016 | Razorpay autopay (P1) Ready to verify

Built (decision 4: only for companies that choose it). An owner or administrator can turn autopay on for a *monthly* plan: a Razorpay plan per Scriwo plan and amount, a first authenticated payment registers the mandate, and each `subscription.charged` event records one payment through the same path as a checkout payment; repeated events create one period. A failed charge shows as overdue and the company can pay by hand; turning autopay off keeps the paid period; paying by hand while autopay is on is refused with an explanation. Yearly plans are not offered autopay.

Verified against a simulated Razorpay only. **Open:** confirm Razorpay's current limits on recurring debits; with 18% GST the Business monthly amount (about 17,699 rupees) is above the 15,000-rupee level up to which recurring debits are usually processed without the customer approving each one.

CRM-017 | GST invoices and receipts (P1) Ready to verify

Built (decision 3). Seller details from the GST certificate: SCRIZA PRIVATE LIMITED, GSTIN 09ABICS9865M1Z8, Ground Floor, 4-5, Logix Park, Captain Vijayant Thapar Marg, near Artech Infosystems Pvt Ltd, Sector 16, Noida, Gautambuddha Nagar, Uttar Pradesh 201301 (state code 09). Buyer details per company (legal name, address, state, GSTIN if any) are asked for before the first payment. Tax is shown separately at 18%: **CGST 9% + SGST 9% when the buyer's state is Uttar Pradesh, IGST 18% for every other state.** Numbers run in a series per financial year without gaps (for example `SCZ/26-27/00001`); the counter moves in the same transaction as the invoice, so a failed payment never uses a number. A PDF is downloadable by owners and administrators; each settled payment gets an invoice, and a payment recorded by hand gets one on request. The PDF writes amounts as "INR" because the built-in font has no rupee sign.

> **Before the first live invoice (accountant):** confirm the invoice fields, the service code (set to `998314`, changeable with `SELLER_SAC_CODE`) and the series wording.

Database and API contract, as built

Entity	Status	Notes
Plan catalogue with prices and limits	Done	`plans`, `plan_prices`, `plan_changes` (018); contacts and broadcasts a month (026). Public read: `/api/public/plans`; platform edit: `/api/admin/plans/:code`.
Subscription period, payments recorded, events	Done	`tenants` period fields and `subscription_payments` (017); `subscription_events` (020).
Orders, payments, webhook receipts, refunds	Done	`payment_orders`, `payments`, `gateway_webhook_receipts` (unique event id), `payment_refunds` (020). `/api/billing/checkout`, `/verify`, `/razorpay/webhook`.
Billing details, invoices, autopay	Done	`billing_profiles`, `invoices`, `invoice_counters`, `razorpay_plans`, `autopay_subscriptions` (020).
Labels	Done	`labels`, `contact_labels`, contact name fields (019). `/api/labels`.
Reply measurements and settings	Done	Computed from messages with `sent_by_user_id`; `report_settings` and per-team targets (021). `/api/reports/*`.
Waiting chats and follow-ups	Done	`conversations.awaiting_since`; follow-ups on a chat, escalation (022).
Number health	Done	Heartbeat, since-when and reconnect columns on `whatsapp_sessions` (023). `/api/sessions/health`.
Assignment rule	Done	`assignment_settings`, `memberships.assignable` and `available` (024). `/api/assignment`.
Support access	Done	`support_access`, `support_access_log` (025). `/api/admin/companies/:id/support`, `/api/workspace/support-access`.
Usage counters	Done	Counted live from contacts and broadcasts instead of kept in a table, so they cannot drift.
Roles	Not required	Owner, Admin, Agent. Team Lead and Finance are not built: decision 6 lets owners and administrators handle billing.

Mandatory release acceptance / QA checklist

Check	Status
No chat history, contacts, numbers, pipeline cards or automation rules lost during migration (migrations are additive; a smaller plan removes nothing)	Done Covered by migration and plan tests
Production checkout uses an authenticated company, verified server-side events, idempotent processing and tax-compliant receipts	Ready to verify Built and tested; real gateway run and the accountant's check are open
Limit checks cannot be bypassed by direct API calls; upgrades and expiry stay consistent when a webhook is late	Done Numbers, people, features, contacts and broadcasts enforced on the server; late webhook covered by the reconciliation job and its test

Check	Status
Cross-tenant tests for contacts, chats, users, numbers, exports, billing, reports and webhooks	**Done** Contacts, chats, numbers, leads, labels, reports, billing (orders, invoices, autopay) and the platform console each have a test that another company's data stays out of reach
Owner overview vs agent-only access; employee performance excludes team notes and automatic messages	**Done**
Message sending follows the actual WhatsApp connection method, consent requirements and platform rules	**Done** Broadcasts need recorded permission and use delays; New chat warns when permission is missing
Observability: logs, failed jobs, payment reconciliation, backup/restore, rollback migration, staging smoke tests	**Partly** Deploy health check, number health, billing audit and reconciliation exist; a staging smoke test and a restore drill are still to do
Razorpay: test-mode run covering a good payment, a failed payment, a tampered signature, a wrong amount, a wrong company, a duplicate webhook, a webhook before the browser verify, the browser verify before the webhook, a lost webhook recovered by reconciliation	**Ready to verify** Passes against the simulated gateway; the run against Razorpay's test mode is the owner's step
Razorpay: webhook delivery from Razorpay's servers to the production address confirmed in the dashboard's delivery log; live keys only after the test run is signed off	**Ready to verify** Waiting for keys
Sign-off from the product owner: sample checkout, one direct message, contact rename, label filter and five manually verified reply-time records	**Not started** The owner's

Open items that need the owner

1. **Razorpay:** create test keys and a webhook secret; put them in the server's environment file (not in chat); add the webhook address in the Razorpay dashboard; run the test-mode list above; then switch to live keys. Until then the payment buttons stay off and `/health` says so.
2. **Accountant:** confirm the invoice fields, the service code (`998314` is set) and the series wording before the first live invoice.
3. **Where people go after paying** (decision 6, cut-off answer): confirm Plans & Billing is right.
4. **UAE:** when the international gateway is wanted, ask Razorpay to activate International Payments (settlement is in rupees), and replace "coming soon" on the plan comparison and the website.
5. **Website wording:** the pricing page still says online payment is "being added for India first". Change it when the keys are live.
6. **Security housekeeping:** replace the AI provider key that was shared in a chat; replace the platform administrator's password written into migration 004 and change that account; turn on branch protection on both repositories so that a push to `main` (which deploys) needs a review.
7. **Prices:** the yearly prices follow "ten months for twelve". If the market rate you meant differs, edit them in *Plans & prices*; no release is needed.

Dev workflow / definition of done (unchanged)

For every task: (1) inspect existing implementation, (2) agree schema + permissions, (3) implement migration/API/UI, (4) add unit/integration tests, (5) validate in staging against actual WhatsApp channel constraints, (6) attach screenshots/test cases to PR, (7) deploy with backup and rollback plan, (8) mark task Done after owner acceptance. In 1.2 the owner asked for tasks to be marked Done once built, so *Done* means built, tested and live; the owner's own acceptance is the last row of the QA list.

Version history

Version	Date	Change
1.0	25 October 2026	First developer backlog: 15 tasks, gates, contract and QA checklist.
1.1	25 October 2026	Status of every task checked against the code; Razorpay specification for CRM-002; CRM-016 (autopay) and CRM-017 (GST invoices) added; contract and QA checklist updated; owner decisions listed.
1.2	25 October 2026	All 17 tasks built; the owner's decisions recorded and built; estimates removed; statuses re-checked against the code and tests; open items for the owner listed.
